

NovaTech Revenue Intelligence

Executive Report

Prepared by Gideon Owusu | September 13, 2026 | For VP Sarah Chen

Executive Summary

NovaTech's revenue engine has clear strengths and clear risks. The Partner Referral channel and NovaPulse product line are outperforming everything else. At the same time, sales cycles are getting longer, and a small number of high-value accounts are showing signs of dissatisfaction. This report explains how we built a unified dashboard to surface these patterns, tested our AI analysis tool, and what the revenue team should do next.

Section 1: Data Strategy

Before this project, NovaTech's marketing, sales, and support data all lived in separate systems. There was no easy way to look at a customer and see the full picture -- how they were first reached, whether they eventually bought something, and how happy they have been since. This report draws on three datasets:

Dataset	What It Contains	Business Question It Answers
Marketing Campaigns	Campaign names, channels, spend, revenue, response flags, and which funnel stage each lead reached	Are our campaigns generating leads that convert?
CRM Deals	Deal values, win/loss outcomes, loss reasons, days to close, sales rep, region, and product	Are we winning deals, and where are we losing?
Support Tickets	Ticket volume by account, priority levels, resolution times, product area, and customer sentiment	Are our customers happy, and who is at risk of leaving?

All three datasets share a common field: the account ID. This is a unique code assigned to every customer. By linking the three datasets together on this shared ID, we created a unified dataset -- a single combined table that shows, for any given account, their marketing history, their deal history, and their support history all in one place.

Why does this matter? Without this connection, the marketing team only knew about leads, the sales team only knew about deals, and the support team only knew about tickets. Nobody could answer a question like: "Has our biggest revenue account been filing a lot of support tickets?" Now they can.

Section 2: Dashboard Design

The NovaTech Revenue Intelligence Dashboard is divided into three sheets. Each sheet answers a different set of business questions and together they tell the complete story of revenue performance from first marketing contact all the way to customer satisfaction.

Sheet	Core Question	Key Visuals	KPI Cards
Marketing Funnel	Are our campaigns working? Which channels produce real results?	Funnel by channel, campaign ROI bar chart, response rate by campaign	Total Leads + Response Rate
Sales Pipeline	Are we winning deals? Where are we losing and why?	Win/loss donut, loss reasons bar, days-to-close trend, revenue heat map	Win Rate + Total Revenue
Customer Health	Are customers happy? Who is at risk of leaving?	Sentiment donut, ticket volume by account, resolution time by priority, at-risk table	Total Tickets + Negative Sentiment %

Design Decisions

- **KPI summary cards:** Each sheet opens with two headline numbers so any viewer can understand the state of that area in under ten seconds, before looking at any chart.
- **Interactive filters:** Every sheet has dropdown filters for region, product line, and date range. The revenue team can slice the data without needing a separate report for every combination.
- **One-click filter action:** On the Customer Health sheet, clicking a segment of the sentiment chart (for example, "negative") instantly filters all other visuals on the page to show only negative-sentiment records. This makes it faster to investigate a problem.
- **Cross-sheet navigation:** A user can click on any account in the Sales Pipeline deals table and jump directly to that account's support details on the Customer Health sheet. This is made possible by the shared account ID field described in Section 1.

Section 3: How AI Configuration Improved Accuracy

The dashboard includes an AI assistant called Q that answers plain-English questions about the data. For example, instead of navigating to a chart, a user can type: "What is the average deal size for Enterprise accounts?" and get an instant answer.

Out of the box, Q works reasonably well, but it does not know what your data means in business terms. A field called days-to-close means nothing to a business user who calls it the "sales cycle." We addressed this by configuring a Topic.

What Is a Topic?

A Topic is a layer of business context placed on top of your data. Think of it as a translator between technical field names and everyday business language. Setting one up involved four steps:

- **Plain-English field descriptions:** We added a short description to every field. For example, "campaign_response" was described as: 1 if the lead responded to the campaign, 0 if not.
- **Synonyms:** We told Q that "deal_value" means the same thing as "revenue," "deal size," or "contract value," so users can ask questions naturally without knowing technical field names.

- **Correct data roles and formats:** We labelled every field as either a dimension (a category, like region or product name) or a measure (a number, like revenue or ticket count), and applied the correct format -- currency, percentage, or duration.
- **Removing noise:** We hid internal system fields like lead_id, ticket_id, and data_source codes that have no meaning to a business user and would only confuse Q's answers.

Before and After

We tested Q by asking the same three questions before and after setting up the Topic. Here is what changed:

Before Topic	After Topic
Technical field names appeared in answers (e.g., "days-to-close")	Q used familiar business terms throughout ("sales cycle")
Currency fields were sometimes shown as plain numbers	Deal values and spend figures correctly formatted as dollar amounts
Cross-dataset questions (marketing + support) were harder to answer accurately	Cross-dataset questions returned accurate results with correct account context

Section 4: Key Insights and Recommended Actions

Five findings stood out from the data. Each has a clear business implication and a specific action the revenue team can take.

Finding 1: Partner Referral is our most valuable marketing channel.

Partner Referral produced 71 Closed Won deals and 131 Qualified Leads -- more than any other channel. Direct Mail had the highest conversion rate at 53%. Organic Search drives the most top-of-funnel traffic but converts to only 6 Closed Won deals, making it the least efficient path to revenue.

Recommended Action: Increase investment in the partner referral program by 20% next quarter and expand the partner network into regions where partner-sourced deals are currently low.

Finding 2: NovaEdge Awareness is underperforming and should be paused.

NovaEdge Awareness has a 4.3% response rate -- the lowest of all six campaigns -- and an ROI of approximately 125x. NovaPulse Launch, by contrast, has a 37.5% response rate and an ROI of 977x. No campaign is losing money outright, but the gap in returns is significant.

Recommended Action: Pause NovaEdge Awareness and redirect its budget to NovaPulse Launch, which delivers the highest revenue (\$394K attributed) and the strongest return on investment.

Finding 3: We are winning just over half of our deals, and most losses are preventable.

Our overall win rate is 56.7% (97 wins out of 171 closed deals). Of the 74 losses, 48 were attributed to three reasons: Competitor Won, No Decision Made, and Poor Product Fit. These are patterns we can address.

Recommended Action: Develop competitive battle cards to help reps respond to head-to-head comparisons. Create a formal follow-up process for stalled "No Decision" deals. Work with Product on the most common fit gaps.

Finding 4: Sales cycles have grown dramatically and need immediate attention.

The average number of days to close a deal rose from approximately 10 days in June 2024 to 107 days in January 2025 -- a tenfold increase in six months. Longer sales cycles slow revenue, tie up rep capacity, and often signal deals are stalling without a clear next step.

Recommended Action: Investigate deals that closed in Q4 2024 and Q1 2025 to understand what caused the slowdown. Set a 60-day deal review trigger so that any open deal older than 60 days automatically triggers a manager check-in.

Finding 5: Our highest-value account is also our highest-risk account.

ACCT-041 (YieldMax Software) filed 327 support tickets -- nearly twice the next highest account -- while carrying \$13.3M in deal value. Across all accounts, 23% of support interactions carry negative sentiment, meaning roughly one in four customers reaching out is already unhappy.

Recommended Action: Assign a dedicated Customer Success Manager to ACCT-041 immediately and schedule an executive business review within 30 days. Establish a weekly review for any account exceeding 100 tickets or 30% negative sentiment.

Section 5: Where the AI Agreed -- and When to Use Each Tool

After configuring the Topic, we asked Q five questions covering all three data areas, including one question that required combining support ticket data with deal revenue data. We cross-checked every answer against the dashboard. The results were encouraging.

All five answers matched the dashboard exactly. No disagreements were found. This validates two things: the data is clean and consistent, and the Topic configuration was effective in giving Q the business context it needed to interpret the data correctly.

Question	Dashboard Answer	Match?	Notes
Which campaign channel has the highest conversion rate?	Direct Mail at 53.0%	Yes	Matched exactly
What is the average deal size by company size?	Enterprise \$1,589 / Small \$1,486 / Large \$1,257	Yes	Matched exactly
Average resolution time for critical vs. low-priority tickets?	Critical 1.79 days / Low 1.97 days	Yes	Matched exactly
Top 10 accounts by ticket volume + total deal revenue? (Cross-dataset)	106,842 tickets / ~\$169.7M revenue	Yes	Cross-dataset handled cleanly

Question	Dashboard Answer	Match?	Notes
Any campaigns where spend exceeded revenue earned?	No campaigns are losing money	Yes	NovaPulse ROI 963x; NovaEdge lowest at 125x

When to Use Q vs. the Dashboard

- **Use Q for quick, specific questions:** "What is the average deal size for Enterprise this quarter?" Q returns a number in seconds without any chart navigation.
- **Use the dashboard for visual patterns and trends:** Spotting that sales cycles doubled over six months is much easier to see in a trend chart than in a text answer. The dashboard is better for exploration and presenting findings to stakeholders.
- **Use both together:** Let the dashboard highlight an unusual pattern, then use Q to dig into the specific numbers behind it.

Closing Note

NovaTech now has a single view of its entire revenue journey -- from the first marketing touchpoint to the last support ticket. The five actions outlined in Section 4 are prioritised by potential revenue impact and urgency. The Partner Referral and NovaPulse opportunities can be captured quickly. The sales cycle slowdown and customer health risks require immediate attention before they affect quarterly results.
